

# **Chronic total occlusion(CTO) revascularization a comparison from Japanese and European expert CTO operators registries.**

**Serikawa Takeshi 2-2-75, Wajirogaoka, Higashi-ku 811-0213 - Fukuoka Japan**

## **Purpose**

**Development of different strategies and devices improved CTO revascularization. However, technical and procedural success might be influenced by several factors including geographical expertise. We examined about difference of CTO procedure in Japan and Euro.**

## **Methods**

**A total of 4412 CTO coronary treated lesions (Japan 1531 Europe 2881) (mean age  $64.5 \pm 10.7$ , male 85.2%, JCTO score  $2.09 \pm 1.24$ ) were analyzed in European and Japanese registries during the year 2016. The primary endpoint was to assess technical success rate of CTO-PCI cases and procedural outcomes.**

## **Results**

**Primary Antegrade approach and success rate were 71.5% and 90.8% respectively in Japan while 77.0% and 94.1%, respectively in Europe, ( $p < 0.001$ ). Primary Retrograde approach and success rate were 28.5% and 84.0% respectively in Japan, while 22.6% and 69.2%, in Europe ( $p < 0.001$ ). There were no differences in technical success rate between Japan and Europe (89.9% vs 88.5%,  $p = 0.13$ ). Procedural time was higher in Japan than in Europe  $156.3 \pm 1.8$  vs  $107.1 \pm 1.3$  mins ( $p < 0.001$ ), but contrast media volume resulted the opposite  $209.6 \pm 3.2$  ml vs  $267.5 \pm 2.4$  ml, ( $p < 0.001$ ). Procedural complications were higher in Japan than Europe (death: 0.4% vs 0.07%,  $p = 0.024$ , myocardial infarction: 1.2% vs 0.57%  $p = 0.045$ , coronary artery occlusion: 0.26% vs 0.07%  $p = 0.026$ , coronary perforation: 4.22% vs 3.04%  $p = 0.045$ ). A multivariate analysis showed that independent predictors of failed procedure were both for Japan and Europe unsuccessful retrograde crossing channel, severe lesion calcification and occlusion length  $> 20$ mm.**

## **Conclusions**

**Technical success rate was similar between Japan and Europe, but more retrograde approach was common in Japan. Unsuccessful retrograde crossing channel, severe lesion calcification and occlusion length  $> 20$ mm were independent predictors of failed procedures for both countries. Procedural complications were higher in Japan probably because of longer procedural time and higher frequency of retrograde approach.**

# Background

**The initial success rate of chronic total occlusion (CTO) percutaneous coronary intervention (PCI) (CTO-PCI) was approximately 60-70%. However, the results improved with the introduction of so-called "hybrid" treatment using a retrograde procedure via the collateral circulation.**

**On the other hand, the standardization of CTOPCI is important, but it has not been sufficiently examined.**

**we examined the results of CTOPCI in different areas of Japan and Europe, the procedure contents, and complications.**

# Methods

## Methods

**A total of 4412 CTO coronary treated lesions (Japan 1531 Europe 2881) (mean age  $64.5 \pm 10.7$ , male 85.2%, JCTO score  $2.09 \pm 1.24$ ) were analyzed in European and Japanese registries during the year 2016.**

## Endpoint

**The primary endpoint was to assess the technical success rate of CTO-PCI cases performed in 2016**

**The secondary endpoint was to evaluate hospital mortality rate, major adverse cardiovascular and cerebrovascular events (MACCE; e.g. death, myocardial infarction, stroke and revascularisation during the following admission), procedure time, amount of contrast media, radiation exposure dose and fluoroscopy time.**

**We examined clinical outcomes between the different PCI approaches, following the intention-to-treat (ITT) principle in Japan and Euro.**

# 2016; Total 1531 CTO Lesions ; Japan

# 2016; Total 1531 CTO Lesions ; Japan

# 2016; Total 2881 CTO Lesions; Euro

# Summary

- ✓ **There was no significant difference of technical success rate between Japan and Euro (89.9% vs 88.5%, P=0.1301).**
- ✓ **In ITT analysis, Japan is significantly higher frequency/success rate of PRA than Euro. On the other hand, frequency/success of PAA of Euro is significantly higher than Japan respectively.**
- ✓ **Procedure complications of Japan is higher than Euro (death, myocardial infarction, coronary artery occlusion, Coronary Perforation).**
- ✓ **In a multivariate analysis, retrograde channel unsuccess, severe lesion calcification and occlusion length>20mm were independent common factors of failed procedure of Japan and Euro.**

# Conclusion

- ✓ **In Japan and Euro, technical success rate was no significant difference.**
- ✓ **Japanese CTO management was observed many complications because of needness of long time procedure and high frequency of retrograde approach.**
